1. Setting up the field

2. Lane segmentation

The YUV color space seems to work best. This is because it can include every color for a specific white value. HSV works similarly but it is hard to find the right saturation value so that the color share stays low enough. RGB does not work well because the gray value correlates directly with the color shares.

Here is an example that shows, that YUV worked better for us. Take a look at the brighter ground on the right:

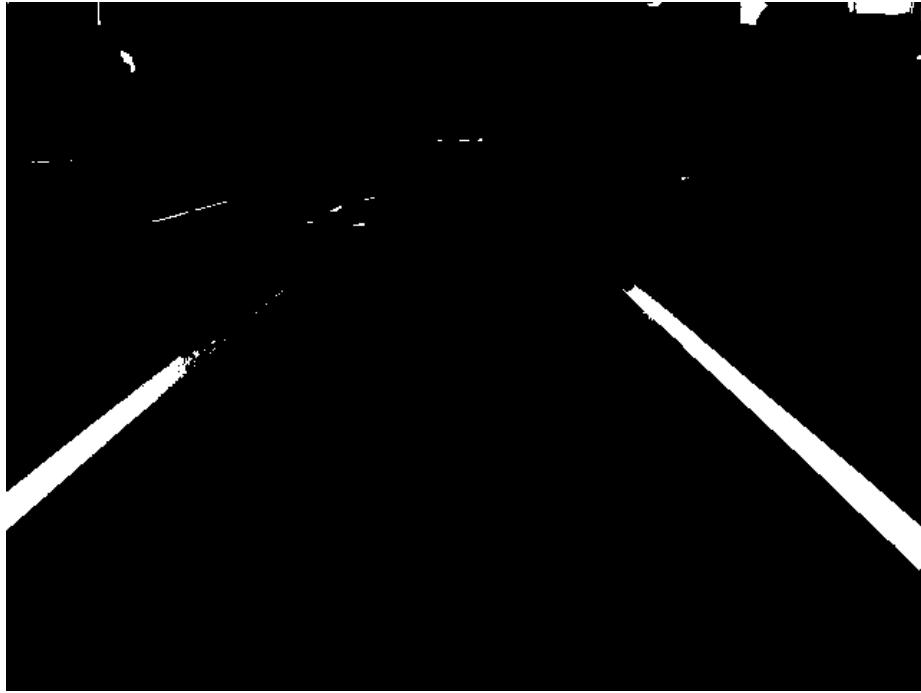

RGB

HSV

YUV

At first, we defined the color ranges to generate a mask for each color space. The method `cv2.inRange` returns this mask with all pixels in our range set to 255.

3. Getting the line

From the binary image of task 2 we set the top 20% of the image to black, to remove the noise.

Then we used `cv.findContours` to get the two white segments with most pixels:

```
im2, contours, hierarchy = cv2.findContours(img, cv2.RETR_TREE, cv2.CHAIN_APPROX_SIMPLE)
contours = sorted(contours, key = cv2.contourArea, reverse = True)
```

We apply the `linear_model.RANSACRegressor()` from *scikit-learn* on our segments to get the line parameters \$m,b\$:

```
def do_ransac_on_contur(contur):
    ransac = linear_model.RANSACRegressor()
    X = []
    Y = []
    for pxl in contur:
        X.append([pxl[0][1]])
        Y.append([pxl[0][0]])
```

```

ransac.fit(X, Y) #build classifier
b = ransac.estimator_.intercept_
m = ransac.estimator_.coef_
return (b,m)

```

Then we can get the start and end points for both lines by applying $f(0), f(image_width)$ for $f(x) = x * m + b$ to draw both lines:

```

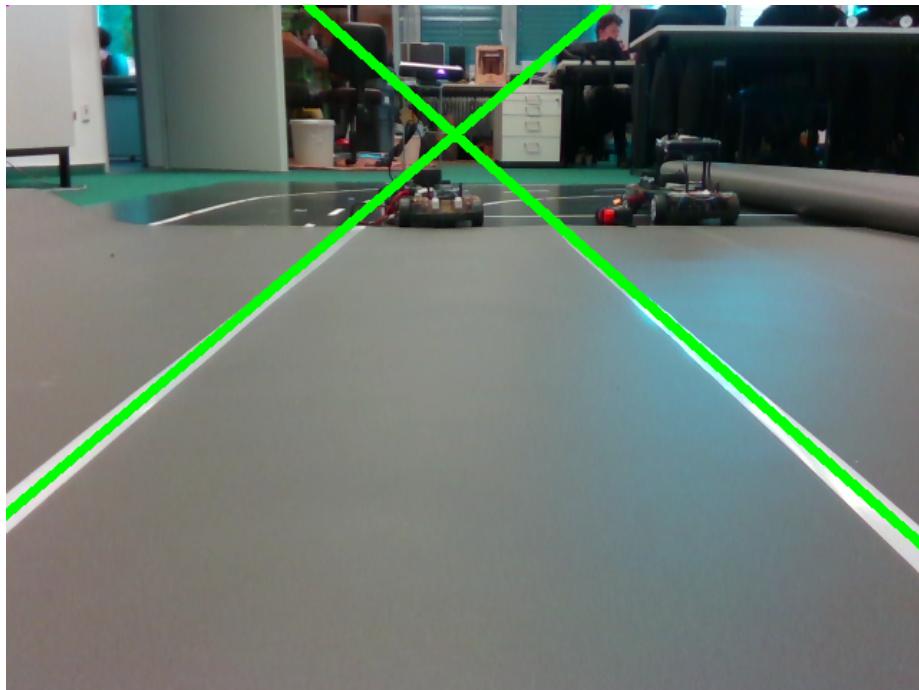

b1,m1 = do_ransac_on_contur(line_segments[0])#get line parameters m,b
b2,m2 = do_ransac_on_contur(line_segments[1])

L1 = mb_to_tupel(b1,m1, img.shape[1]) # m,b to start and end point in image
L2 = mb_to_tupel(b2,m2, img.shape[1])

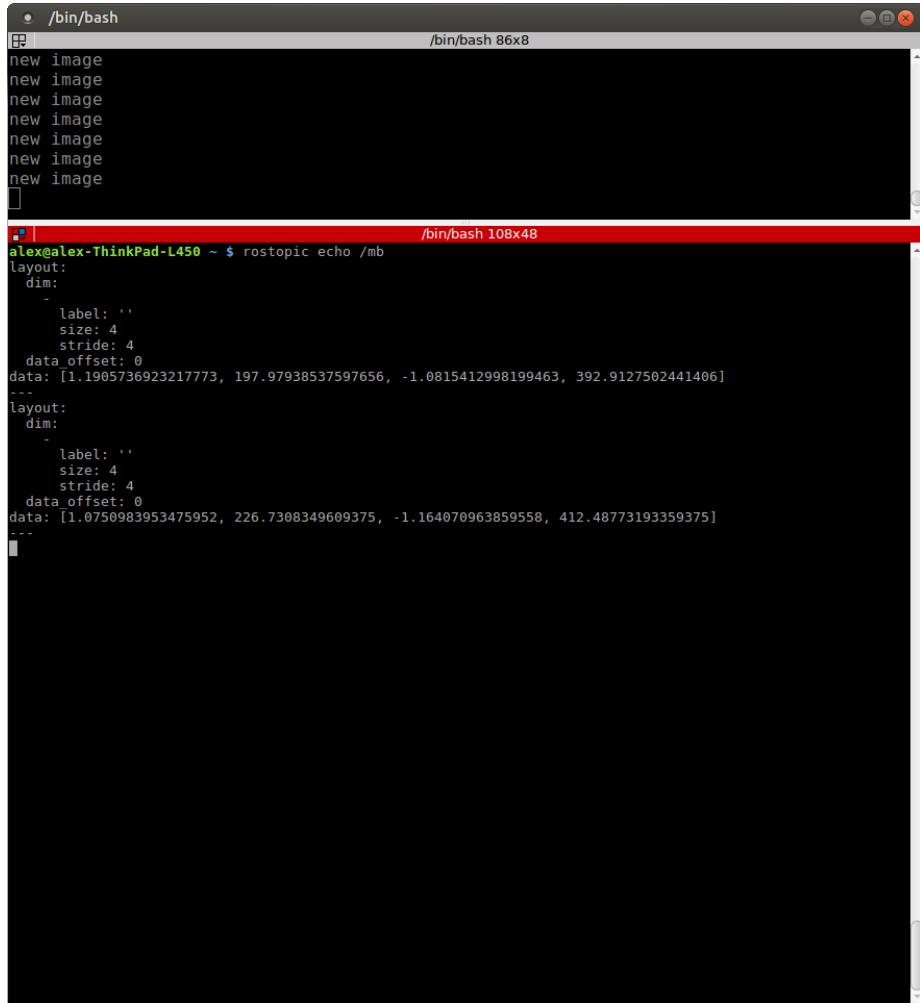

cv2.line(original_img, L1[0] , L1[1],(0,255,0),5)
cv2.line(original_img, L2[0] , L2[1],(0,255,0),5)

```

Here is the output image:

Finally we published the line $[m1, b1, m2, b2]$ by using a `Float32MultiArray` to store multiple values:

The screenshot shows a terminal window titled '/bin/bash' with a red header bar indicating the window size is 108x48. The terminal displays the output of the command 'rostopic echo /mb'. The output shows two message structures for the topic '/mb'. Each message has a 'layout' field containing a 'dim' array with two elements, each having 'label', 'size', and 'stride' fields set to 4, and a 'data_offset' field set to 0. The first message's 'data' field contains three floating-point numbers: 1.1905736923217773, 197.97938537597656, and -1.0815412998199463. The second message's 'data' field contains three floating-point numbers: 1.0750983953475952, 226.7308349609375, and -1.164070963859558.
